

— ICT WEEK UZBEKISTAN · 2026 · PRE-SEED

flex

Your number is your identity.

A unique number and an NFC object that opens it.
One tap — nothing to install.

Paper is printed once. Everything else changes.

A card is out of date the day it is printed

A new job, a new number, a new company — and the box in the drawer is wrong. People hand them over anyway.

A menu is a photograph of last month's prices

A cafe reprints, or crosses lines out with a pen. The dish that ran out at lunch is still on every table.

A table cannot ask for anything

A guest raises a hand and waits for someone to look. The cafe never learns which tables waited, or for how long.

One tap — and the page opens.

Nothing to install. Nothing to sign up for. The guest taps their own phone, and that is the whole of it.

THE SOLUTION

One tap, and the page opens.

1 The number

Three letters and three digits — MYN042 — become an address, and it is yours for life.

2 The object

A card, a ring, a bracelet, or a tag on a table. An NFC chip and a QR code inside.

3 The page

The guest taps their own phone and it opens in their own language. Nobody installs anything.

Something you can hold.

Card

In a pocket, in a wallet

200,000 UZS

Ring

On a hand, always with you

350,000 UZS

Bracelet

On a wrist, for events

250,000 UZS

Car card

On the windscreen

On request

One number, many faces.

The owner picks the card design, and every one of them is drawn by us rather than borrowed. A low serial number cannot be reproduced at all — which is the one thing on the card that is genuinely scarce.

Xarita

Suzani

Rahbar

DevOps

Everywhere somebody is served.

Cafes and restaurants

Menu, table tags, calling a waiter, the bill

Hotels

Service list, room tags, housekeeping requests

Shops and salons

Prices, payment details, calling for help

The half a printed menu cannot do.

- 1 Every table has its own QR code and its own NFC tag
- 2 The guest taps it — the menu opens in their language
- 3 One tap: a waiter, the bill, or a review
- 4 It lands on the phone by the till with the table number, and it rings
- 5 Nobody signs in — the phone stays on one link

Printed on Monday, answering by Tuesday.

 A QR and NFC tag per table

 A sheet ready to print and cut

 A counter screen with sound

 A monthly report

 Uzbek, Russian, English

The owner types the tables, prints the sheet and puts a card on each one. Every code carries its own table number.

A number once. A venue every month.

Personal number

Priced by rarity · paid once

from 100,000 UZS

Device

Card, ring or bracelet · paid once

200,000 – 350,000

Venue, up to 15 points

A cafe with twelve tables

149,000 / mo

Venue, up to 40 points

A hotel with thirty rooms

299,000 / mo

How they pay

Individuals pay by card through Payme.
Venues and companies pay by invoice and bank transfer, which is how a business here actually pays.

Recurring revenue, at the smallest band.

100 VENUES

14.9M

a month · $\approx$ 179M UZS a year

500 VENUES

74.5M

a month · $\approx$ 894M UZS a year

1,000 VENUES

149M

a month · $\approx$ 1.79B UZS a year

At the entry band of 149,000 UZS and nothing above it — a hotel or a larger restaurant pays twice that. Devices and personal numbers are not counted here at all. These are venue counts, not a market size.

Three things are true at once.

The phones are ready

Every phone sold in recent years reads NFC, and after 2020 a QR code on a table needs no explaining to anyone.

Service is the battleground

Cafes and hotels no longer compete on price alone. How fast somebody answers a table is a thing guests notice.

The rails exist

Payme and bank transfer make a monthly subscription collectable from a business — what turns this from a gadget into revenue.

Built, deployed, and running.

- Personal profiles, devices, QR codes and analytics
- Venue menu and service list — in three languages
- A separate QR and NFC tag per table, with a printable sheet
- Guest requests: waiter, bill, housekeeping, reviews
- Counter screen with sound, and a screen that stays awake
- Monthly report: response time, busiest tables and hours
- Subscriptions, invoices and expiry reminders
- Telegram sign-in • Payme integrated

Open to anyone, today

flex.com.uz/NAV001 is a real venue. Open it on your phone, read the menu, call a waiter, and watch it arrive at the till.

Nobody local sells the venue half.

UNQX	The same three-letter, three-digit format. Personal profiles only. Live in the Fergana Valley.	No menu, no tables, no requests — the recurring half is missing.
International NFC cards	Popl and the rest. Personal profiles, sold worldwide.	No local payment, no invoice for an accountant, no Uzbek.
Paper and pen	What every cafe uses today. Free.	Cannot tell you which table is waiting, or for how long.

TEAM

Who is building it.

Three people. Product, web and sales, all in-house. The first version was built without an outside team, and it is running today.
